

PANEL W

build. simple.

PRODUCTS

ACCESSORIES

The **ZIG ZAG**, **FLAT MESH** and **L MESH** are the indispensable complements of PANEL W. Which are of mandatory use to insure the structure continuity in all the junctions between panel to panel.

BRACE

It's a simple and practical connector that is used for anchoring PANEL W (for non structural use) to existent walls, floors and roofs.

ZIG ZAG

Exclusive PANEL W accessory which provides an unequal mechanical anchorage between panels, this is achieved by bending the leads with the wire wrapping hook from the top side down in one side and from the bottom side up in the other side.

L MESH

Provides a reinforcement between junctions in perpendicular panels, easily secured by means of wrapping annealed wire in both sides.

The L MESH is also used to provide reinforcement in the perimeter of doors and windows, and to cover installations in the case of cutouts performed in PANEL W

FLAT MESH

The flat mesh provides anchoring by means of a steel overlap this is accomplished by centering over the junction and securing it by wrapping annealed wire in both sides. The junction must always be done in both sides.
